CONCEPT OF PEST CONTROL AT QPS

Pest control is the management and regulation of unwanted Organism, known as pests, that can adversely impact human activities, agriculture, and the environment. The primary goal of pest control is to prevent or minimize the damage caused by pests, whether they are insects, rodents, fungi, or other harmful organisms. This involves employing various methods, such as biological, chemical, mechanical, and cultural controls, to mitigate the risks associated with pest infestations. Effective pest control is crucial in safeguarding public health, protecting crops, and maintaining the integrity of eco systems, contributing to a healthier and more sustainable environment.

OUR VISION

To be pioneers in sustainable and innovative pest management, fostering a world where humanity coexists harmoniously with nature. We aspire to lead the way in developing cutting-edge solutions that not only eliminate pests but also contribute to ecological balance and promote the health and prosperity of all living beings.

OUR MISSION

We believe in a proactive approach to pest management, emphasizing prevention, safety and environmentally responsible practices.

PEST SOLUTIONS

PEST CONTROL MAJORLY COVERS

Inspection and Assessment:

Professional pest control services often start with a thorough inspection of the premises to identify the type of pests, the extent of infestation, and potential entry points.

CUSTOMIZED PEST MANAGEMENT PLANS:

Based on the assessment, pest control experts develop customized management plans. These plans may include specific strategies for eliminating existing pests and preventing future infestations.

CHEMICAL TREATMENTS:

When necessary pest control services may use chemical treatments to control or eliminate pests. This can include the application of pesticides, insecticides, and rodenticides.

EXCLUSION AND SEALING:

Pest control services often focus on sealing entry points to prevent pests from entering buildings. This can involve repairs to cracks, gaps, or other vulnerabilities in structures.

MONITORING AND PREVENTION:

Regular monitoring is crucial to identify early signs of pest activity. Pest control services may set up monitoring devices and provide ongoing prevention strategies to avoid future infestations.

EDUCATION AND AWARENESS:

Some pest control services also engage in educating clients about best practices for preventing pests. This may include proper waste management, maintaining cleanliness, and addressing conditions that attract pests.

SERVICES PROVIDE BY QPS:

- Cockroach Control
- Rodent Control
- Termite Control- Pre construction and Post construction.
- Bed-bugs Control
- Ant and flies Control
- Sanitization & Disinfestation

QUBE

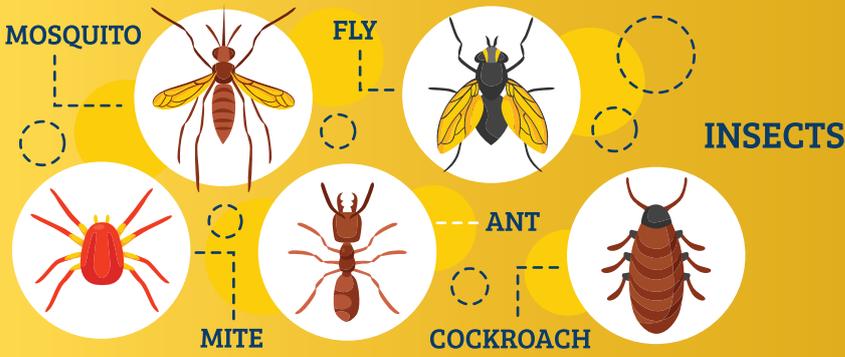

PEST SOLUTIONS

COCKROACH CONTROL

QUBE PEST SOLUTIONS provides cockroach control utilizing the latest methods of Integrated Pest Management. The main attractions for a cockroach are usually food, water and damp environment. Cockroaches are a public health concern as they carry Salmonella bacteria - the organisms responsible for food poisoning). They are nocturnal and also also can be found under the cleanest conditions. Cockroaches are the most common pests that spread germs. For ultimate cockroach prevention and cockroach control, seal all holes and cracks that may provide an inlet for a cockroach. Its important to keep the house clean. Cockroaches feast on everything right from garbage to wallpaper paste, etc, but keeping your home free of food particles will send cockroaches packing in search of a dirtier place – and prevent you from all your pests.

PEST CONTROL

RODENT CONTROL

Rats are some of the most troublesome and damaging rodents in India. They consume and contaminate food, damage structures and property, and transmit parasites and diseases to other animals and humans. Rats habitat and thrive under different climatic conditions. They are often found in and around homes and other buildings, farms, gardens, etc.

TERMITE CONTROL

The wood eating habit of these termites make them feed on any type of wooden articles. As they remain concealed to protect themselves from unfavourable climate, it is difficult to detect them until major damage has been done. As soon as they enter a building they do not limit themselves to wood but infest other things made up of cellulose. Termites have a major entry to a building is through soil., but can even be transmitted through soft plastics, plaster, rubber and sealants such as silicon rubber and acrylics and Construction materials. Any material which is in direct contact with the soil such as trees, vines or plumbing fixtures serves as an avenue of infestation.

BED-BUG CONTROL

While bedbugs have been known to harbour pathogens in their bodies, including plague and hepatitis B, they have not been linked to the transmission of any disease and are not regarded as a medical threat. Some individuals, however, can get skin infections and scars from scratching bites. While bedbugs are not regarded as a vector of transmissible diseases, they may be a significant source of alarm or distress. Bedbugs are generally active only at dawn, with a peak attack period about an hour before dawn, though given the opportunity, they may attempt to feed at other times. Attracted by warmth and the presence of carbon dioxide, the bug pierces the skin of its host with two hollow tubes. With one tube it injects its saliva, which contains anticoagulants and anaesthetics, while with the other it withdraws the blood of its host. After feeding for about five minutes, the bug returns to its hiding place. The bites cannot usually be felt until some minutes or hours later, as a dermatological reaction to the injected agents.
